License Management Server

For license management purposes, your GENIUS TOOLS License Manager (FlexNet Server) must either be installed locally or be reachable through your network.

4 Update

If GENIUS TOOLS for Creo are already installed and you want to perform an update, you can follow the steps for a new installation.

The installation routine recognizes the existing installation and offers you the update or a reconfiguration.

The resource directory is not updated by the setup process in order to protect company specific configuration settings from overwriting. To update this directory you can use the Configuration Utility in the directory *<InstallationDirectory>\software\bin*. Additional information can be found in the GENIUS TOOLS for Creo help.

But it is possible to apply the settings in the resource folder. For this, you have to copy the files into the new GENIUS TOOLS for Creo resource folder.

Warning: Please make sure to create a backup of both resource folders!

After the first start of Creo with GENIUS TOOLS for Creo you can use the Configuration Utility to update the resources and the databases to the current version.

5 Additional Configuration

If you want to customize your GENIUS TOOLS for Creo installation, you can find additional information in the help file.

You can open the help via the ribbon GENIUS TOOLS in Creo or via the *software\help* sub-directory in your installation directory.
